

A WORKSHOP

# Embedded Systems Made Easy

Sanjeet Raj PANDEY  
Technical University Berlin  
GERMANY

*Date and Venue:*

10 - 11 March 2014  
Hotel Manaki, Janakpur  
NEPAL

# 1 Motivation

Advanced in technology needs a careful and continuous following. Mobile systems, broadcasting methods, medical technology are few technologies without which life is hard to imagine. Technology is leading the frontiers from saving lives, security, defense, and space exploration to mundane aspects as entertainment or social networking. Electronics, than ever before, is vital part of any society now.

Big industries are investing millions to get innovative application out of Embedded Systems today, they also, however, have started a culture of patents and closed sources. On the other hand, Homebrew, Do It Yourself (DIY) and Open Source are playing important role to keep these technologies transparent and accessible.

Open Source Hardware and Software have been massively improved in the quality, user experience and have become more affordable to buy. We are motivated to promote this experience to school students and the enthusiasts; introduce them the possibilities beyond simple transistor circuits and facilitate them venture into the embedded systems.

A do it yourself workshop on embedded electronics and applications is an initiative with following key ideas:

- How simple and easy it is
- Think beyond
- Internet of things
- Cheaper hardware
- Coding has never been easier
- Understanding how complex devices work ...

# 2 Programme

The main agenda is learning by making, therefore, maximum time is assigned for DIY sessions.

1. Each session can have maximum of 10 groups with 2 students per group

2. Each session has spans for 1.45 hour
3. First 20 Minutes will be for basic introduction of:
  - Basic electronic components (LED, Resistor, Relay, Transistor)
  - Microcontroller
  - Basic C coding
4. Do It Yourself (DIY) session for 1 hour with one of the 5 projects:
  - Blink LEDs, Switching and reading Analog signals
  - Reading temperature value
  - Magnetic switch
  - Light sensing
  - Motor driver
5. Demonstration of some finished projects, as, SMS controlled Lights, RGB Lighting
6. Link will be provided prior to Workshop for software along with related documentation.
7. There will be also an open discussion at the end of the programme. Participants are encouraged to interact and pose questions

### **3 Session description**

Due to Limited supply of hardware/components, sessions are conducted in groups with a question-answer session at the end.

1. Each session will have maximum of 20 students forming 10 groups.
2. Each session is dedicated to one institution only.
3. There will be a list of different projects. Each group selects a project from this list.

4. Each group gets a Hardware Kit pre connected to PC
5. Groups can bring their own laptop, this is highly recommended.
  - Can save project data
  - Less electrical supply uncertainty
  - Software can be pre installed to save time
  - Latest OS (tested on windows 7,8, Ubuntu 12.04 or higher, OSX)
6. Participants must exhibit discipline. Any violation of norms may result in disqualification of the individual participant.

## 4 Requirements

We are delivering main hardware kits from outside of Nepal (Germany), therefore, participating institutions should cover their expenses. Each hardware kit contains a complete set of components to begin with basic microcontroller circuits. The price we set for each hardware kit is Rs.8800 . Hardware Kit will be distributed after the workshop. We hope:

- Each participating institution could buy 3 to 5 hardware kit.
- Institutions may choose to participate without purchasing the hardware kit for Rs. 3500.

Rs. 8800 is the basic raw materials cost of these kits. The institutions willingness to buy these kits will help us finance the workshop. It is also beneficial for their students to gain more hands on experience with these equipment.

### 4.1 Online registration

Participating students are encouraged to register online via:

- [https://bitbucket.org/sanju\\_gem/embedded-system-workshop/](https://bitbucket.org/sanju_gem/embedded-system-workshop/)
- <http://goo.gl/P72HDB>

This will help us keep track of the number of students, and organize the number of copies of software and hardware we should manage. This will also be helpful to keep record of their progress and communicate with them in future in case they are willing to learn more or want some help.

## 5 Future possibilities

After the completion of workshop, students will have working knowledge of Embedded Systems, programming them, designing new projects and using them. Here are few popular topics that will be introduced as potential projects:

1. Basic Robotics, i.e. motor control, digital switching and sensing
2. Sensors, Temperature Alarm Systems, Distance measurement, and Reed Switch
3. LED, Dimmers, Optical electronics i.e. LCD, Touch Sensing etc.
4. Power Regulation, AC switching
5. Radio and wireless
6. Binding things to internet
7. BUS systems (SPI,  $I^2C$ , 1-Wire etc.)
8. DIY Gadgets
9. Data Logging
10. GPS Sensing
11. Advance Hardware and Microcontroller (ARM and Higher AVR)

*Skill to do comes of doing*
